CUVÂNT ÎNAINTE

Catalogul armăsarilor pepinieri este un document de interes zootehnic menit să prezinte, într-o manieră sintetică și accesibilă, însușiri genotipice și fenotipice ale reproducătorilor masculi existenți în cadrul unei rase, la un moment dat. Datele furnizate de catalog sunt utile crescătorilor de cai în alegerea armăsarilor reproducători și în luarea deciziilor de potrivire a perechilor.

Pedigreul oferă informații despre ascendentă, pe baza căreia pot fi calculați: coeficientul de înrudire al perechii ($r_{x,y}$) (Wright) și apoi coeficientul de consangvinizare al potențialului descendenter ($F_{x,y}$) (Wright).

Crescătorul își poate forma o imagine de ansamblu despre exteriorul animalului din fotografiile zootehnice și din valorile principalelor măsurători somatometrice: înălțime la grebă, perimetru toracic, perimetru fluierului.

În funcție de obiective, de factorii ameliorării genetice utilizati: selecția (intrafamilială), consangvinizarea și încrucișarea (rotativă interfamiliară), crescătorul poate să decidă care este cel mai potrivit armăsar pepinier pentru obținerea următoarei generații de produși în propria crescătorie.

Catalogul cuprinde reproducătorii masculi existenți în România în acest moment din cadrul rasei Lipitan, cu număr de armăsar pepinier, care au fost confirmați de Comisia Națională de Evaluare și Clasare a Cabalinelor în cadrul lucrărilor de clasare și calificare a cabalinelor desfășurate în 2006, atât în sectorul de stat – Hergheliile Sâmbăta de Jos și Beclean, cât și în cel privat – la membri ai Asociației Crescătorilor Particulari de Cal Lipitan din România.

În catalog apar reprezentanți din toate cele 8 „linii de sânge” ale rasei Lipitan, recunoscute de Lipizzan International Federation (LIF): Conversano, Incitato, Favory, Maestoso, Neapolitano, Pluto, Siglavy Capriola și Tulipan.

Grație sistematizării informației genealogice pe „familii de iepe” întreprinse de către Dr. Niculae Ramba, inspector șef AHN, Centrul Regional Sâmbăta și ing. Romfeld Janos, director executiv al Asociației Crescătorilor Particulari de Cal Lipitan din România, catalogul încadrează fiecare armăsar într-una din cele 13 familii al rasei Lipitan din România, recunoscute de LIF.

În legătură cu utilizarea termenilor „linie de sânge” și „familie de iepe” se cuvin unele precizări. Termenii amintiți nu exprimă categorii taxonomice, ci sunt forme convenționale, tradiționale în vocabularul uzual al crescătorilor de cai, prin care sunt sugerate succesiunile genealogice pe calea tatăilor, respectiv a mamelor.

Efectivele mici de animale din matca hergheliilor, cuprinzând de regulă maximum 40 – 150 de iepe, dar cu un număr de armăsari, între 4 și 12, au impus un principiu tehnologic de selecție particular - creșterea în „linii de sânge” (Drăgănescu, 1979). Astfel, în condițiile limitate de posibilitățile reduse ale schimbului de reproducători între herghelii, crescătorii au fost nevoiți să evite în mod deliberat neajunsurile consangvinizării prin selecție. Consangvinizarea poate fi astfel controlată în populațiile închise prin selecție intrafamilială („linii de sânge”) respectiv înlocuirea fiecărui reproducător sau cel puțin a masculilor, prin unul din descendenții lor (scăderea, chiar reducerea la zero a varianței mărimii familiei) și prin încrucișarea rotativă interfamilială, respectiv dirijarea împerecherilor în aşa fel încât să se evite împerecherile înrudite apropiat (Drăgănescu C., 1979; Drăgănescu C.; Grosu, 2003). De la acest principiu tehnologic de selecție nu trebuie să facă excepție Hergheliile Sâmbăta de Jos, Beclan și nici crescătorii membri ai ACPCLR.

Drd. Ing. Mihail Lechkun
Consilier AHN

Foreword

The stud catalogue is a document meant to show in a concise and accessible manner some genotype and phenotype characteristics of the male reproducers existent at one moment for the specified horse race. The information contained in the catalogue is used by breeders to make the best choice in horse mating.

For a potential mating, the record of horse descent (pedigree) will be used to determine Wright's Coefficient of Relationship (RC) and the Wright Inbreeding Coefficient ("WIC") of the foal.

Other relevant information about the physic of a particular specimen is provided by standard photos and from specific measurments: Height at withers, Chest girth, Cannon bone circumference fore limb.

Based on the aimed goals and the method of use factors of animal improvement (intrafamilial selection, inbreeding, interfamilial crossbreeding), the breeder can decide which specimen should be considered in obtaining the next generation of horses for its own farm.

The catalogue lists all the registered (with assigned Stud Horse Id #) Lipizzaner studs existing in Romania at present and which were confirmed by the National Commission of Equine Evaluation and Classification (Comisia Națională de Evaluare și Clasare a Cabalinelor - CNECC).

The catalogue shows data of the 2006 annual classification and evaluation workshop organized by CNECC for state run stud herds (Sâmbăta de Jos herd and Beclean herd) and also for the private breeders (members of the Romanian Association of Private Breeders of Lipizzaner, "Asociația Crescătorilor Particulari de Cal Lipitan din România" - ACPCLR). The next update is scheduled in 2007.

Surveyed and listed studs comprise both private and state run stud farms and lists specimens belonging to the 8 blood lines (Conversano, Incitato, Favory, Maestoso, Neapolitano, Pluto, Siglavy Capriola și Tulipan) recognized by the Lipizzaner International Federation - LIF.

It is the merit of Dr. Niculae Ramba, and Eng. Romfeld Janos to have systemized the genetic information of "mare families". With his action, every registered horse is thoroughly listed under one of the 13 families recognized by LIF in Romania.

Some clarifications have to be made regarding the terms "blood lines" and "family of mares". These terms do not reflect domestic-animal taxonomy categories, but express conventional forms, used currently and frequently by equine breeders to suggest generational succession on a paternal or maternal basis.

The small number of specimens from a stud farm (with a maximum of 40-150 mares and 4-12 stallions) imposed a certain technological method of selection, namely breeding in "blood lines" (Draganescu 1979). Due to the limited possibilities of exchanging the stud horses among the herds, the breeders had to find a method that avoids abnormalities due to selective consanguinity. The principle behind the method is that breeding for closed pools of specimens should be done either by replacing each particular breeding animal or at least the stud horse by one of its descendants (familial variance is reduced or avoided) or by interfamilial crossbreeding on a rotational basis, so that inbreeding among close related specimens is avoided (Drăgănescu C., 1979; Drăgănescu C.; Grosu, 2003).

The selection of breeding specimens based on the above mentioned method is mandatory for state run stud farms (Sâmbăta de Jos, Beclean) and also for private breeders (members of ACPCLR).
